

Request for Proposal

AI-Assisted Tier 2/3 Application Management & Service Desk Platform

Synthetic procurement request authored for the Agentic RFP Evaluation mini project. No real confidential supplier or client data is used anywhere in this document set.

1. Background

Meridian Energy Services operates a global portfolio of internal business applications supporting finance, supply chain, and field operations across Europe, the Americas, and India. The current service desk relies on manual ticket triage and a legacy ITSM tool with limited automation. Meridian is seeking a supplier to deliver a modern, AI-assisted Tier 2/3 application management and service desk platform, replacing or substantially augmenting the existing setup within a 24-month managed services contract.

2. Scope of Work

The selected supplier will provide: (a) Tier 2/3 incident and request management for a portfolio of approximately 40 business-critical applications; (b) an AI-assisted triage and categorisation layer that reduces manual dispatch effort; (c) integration with Meridian's existing ServiceNow instance via REST APIs; (d) a knowledge-base and self-service portal for end users; (e) 24x7 coverage across three global regions with follow-the-sun handover; (f) monthly service reporting against agreed SLAs and continuous improvement commitments.

3. Technical Requirements

Proposals must describe the proposed architecture, how AI/automation components are deployed responsibly (including guardrails against incorrect automated actions), integration approach with ServiceNow, scalability to handle seasonal ticket-volume spikes of up to 3x baseline, and a rollback plan if the AI-assisted triage misclassifies a ticket.

4. Implementation & Transition

Proposals must include a transition plan of no more than 90 days from contract signature to full service, covering knowledge transfer, staffing ramp-up, shadow-running period, and a clearly defined go-live gate. Given that Meridian currently has an incumbent supplier for part of this scope, proposals should address transition risk and disruption to business operations explicitly.

5. Commercial Requirements

Proposals must include a price table covering setup/transition cost and steady-state monthly run cost for Year 1 and Year 2, with all assumptions stated explicitly (e.g. ticket volume assumptions, included vs. chargeable change requests, currency, inflation/indexation clauses).

6. Security & Compliance Requirements

Given the sensitivity of the applications in scope, proposals must describe data handling and access control practices, relevant certifications (e.g. ISO 27001, SOC 2), audit logging capability, and incident response commitments. Meridian requires all supplier personnel with production access to be background-checked and all data processing to remain within contractually agreed jurisdictions.

7. Support Model & Experience

Proposals must describe the proposed support model (shift structure, escalation paths, named leadership), at least two comparable reference engagements of similar scale, and any experience specific to Meridian's current environment where applicable.

8. Submission Requirements

Each proposal should contain: an executive summary and understanding of the requirement; the proposed solution and implementation approach; timeline, team structure and milestones; a price table with assumptions; security, compliance and risk controls; and the support model, relevant experience and references. Proposals will be evaluated on technical capability, implementation plan, commercial value, security & compliance, and support & experience.
